                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Biol. Chem.
                                                                                                          the treatment of strabismus and blepharospasm associated dystonia and cervical dystonia. Also used for the treatment for the treatment and spasm and a number of other neurological disor characterized by abnormal muscle contraction. MISCELLANDOUS: There are seven antigenically distinct for botulinum neurotoxin: Types A, B, Cl. D, E, F, and G. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-cln-l-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      failure (By similarity).

-I- CANALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobravins, SNAP25 or syntaxin. No detected action on small molecule substrates.
-I- SUBUNIT: Disuffide-linked heterodimer of a light chain (L) and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-[-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transmembrane; Hydrolase; Metalloprotease; Zinc.

                         A polypeptide (AAW09014) comprises the heavy chain (amino acids 848-1278) of a type F botulinum neurotoxin (BoNT/F), and can be produced using a synthetic gene (AAF48101) based on the natural gene sequence (AAF48101) for the heavy chain. The polypeptides its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin, making the useful for vaccine prodn. Recombinant polypeptides can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BoNT/F). They lack the L chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification.

The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin producting bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                    Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; diphtheria neurotoxin; botulinum neurotoxin type F; BONT/F.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 432 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the
                                                                                                                                                                                                                                  Chimeric - Bacillus stearothermog
Chimeric - Influenza virus.
Chimeric - Clostridium botulinum.
Chimeric - Synthetic.

```
CC therapeutic agent to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain (amino CC domain of HC, designated as HN), that translocation domain is not a fragment into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn superoxide dismutase (MnSOD), from CC conjugate comprises bacterial Mn superoxide dismutase (MnSOD), from CC conjugate comprises bacterial Mn superoxide dismutase (MnSOD), from CC binding domain from botulinum neurotoxin type F (BoNT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New non toxic polypeptide for delivery of a therapeutic agent treatment of a CNS disorder comprising a binding domain that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 9; Page 43; 50pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    translocates the therapeutic agent into the neuronal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN of that translocation domain is not a HN of the translocation domain is not a HN of the translocation domain is not a HN of a clostridial neurotoxin and is not a fragment or derivative of CC als did domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat disorders of the CC and infection. They are also useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate.

CC This conjugate comprises bacterial Mn superoxide dismutase (MnSOD), from CC Encillus stearothermophilus, linker that can be cleaved by factor Xa, CC translocation domain from diphtheria neurotoxin and a neuronal cell-sxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 143;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              domain of a clostridial neurocoxin and is not a fragment or derivative of a NN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful to treat disorders of the substances to neuronal cells. They are useful to treat disorders of the constructs are useful to treat disorders of the substances to neuronal cells. They are useful to treat disorders to the constructs and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises a mitochondrial leader sequence from human Mn-superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus, linker that can be cleaved by thrombin, translocation domain from diphtheria neurotoxin and a neuronal cell-specific binding domain from obtulinum neurotoxin type F (BONT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as Hc) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as Hy), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN
                                      C. botulinum C2 translocation domain with BoNT/F-binding domain #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1999; 99GB-0028530

                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                         В
                                                                                                                                                                                                                                                                                                                  Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) off a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial neurotoxin and is not a fragment or derivative of CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC useful infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum CC neurotoxin type F (BoNT/F) binding domain used in the exemplification of the invention of
                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                    by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic.

The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the SOD of the is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as schemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neuronal diseases.

                                                                                                                                                                                                                                                                                                                               QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a non toxic polypeptide, for delivery of a characteristic agent to a neuronal cell, which comprises a binding domain coarboxy terminal half of heavy chain (HC) of a neurotoxin, designated cas HO) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic coagent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic coals. The polypeptide constructs are useful to treat disorders of the country of the country of the polypeptide constructs are useful to treat disorders of the country of the present sequence is C. Sottlinum C2 enterotoxin translocation domain with botulinum cas enterotoxin translocation domain with botulinum of the invention.
                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                   a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein cencoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AAY77134-Y77139 represent

The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (HC) from BONT serotypes A-G. In preferred embodiments of the invention, the vector is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Botulinum neurotoxin; heavy chain; BoNT; serotype F; C-terminal fragment; Venezuelan equine encephalitis virus replicon; VEE; botulism; vaccine; diagnosis; drug screening.

                                                                                                                                                                                                                                                              This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA sequence (see AAV30593) In plasmid pETHisb. This vector can be used to express BotC soluble C fragment in Escherichia coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins
                                                                                                                                                                                                                                                                                                                                                                                        Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin
                                                                                                                                                    recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                          contamination. Preferred hosts for production or reproteins are E. coll, insect cells and yeast cells.
                                                                                                                                                                                                     derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant

                                                                                                                                                                                                                                                         Botulism neurotoxins are translated as a single 150 kDa polypeptide CC chain and then posttranslationally nicked, forming a dichain CC consisting of a 100 kDa heavy chain and a 50 kDa light chain which CR carboxy-terminal (HC) or amino-terminal (HM) portion of the heavy CC chain of botulinum neurotoxin (BONT) can be used in recombinant CC peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes CC protective immunity against botulinum neurotoxin, which causes CC organisms such as Escherichia coll or Pichhia pastoris. The use CC of recombinant nucleic acids are expressible in a recombinant CC organisms such as Escherichia coll or Pichhia pastoris. The use CC the need to culture large quantities of hazardous toxin-producing CC the need to culture large quantities of hazardous toxin-producing CC the need to culture large quantities of hazardous toxin-producing CC is also high and cost of production is lower. The nucleic acids can CC be derived from Clostridium botulinum serotypes A-G.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score

A ABEL T., Bhatt R., Maniatis T.;

T A Drosophila (REB/AFF transcriptional activator binds to both fat T a Drosophila (REB/AFF transcriptional activator binds to both fat T body and liver-specific regulatory elements.";

L Genes Dev. 6:466-480(1992).

C -!- FUNCTION: TRANSCRIPTIONAL ACTIVATOR. BINDS TO FAT BODY-SPECIFIC CENHANCERS OF ALCOHOL DEHYDROGENASE (Ah!) AND YOLK PROTEIN GENES.

C BBF-2 MAY PLAY A ROLE IN FAT BODY GENE EXPRESSION. IT BINDS THE CONSENSUS SEQUENCE 5'T(A/C)NACGTAN(T/G)C-3'.

C -!- SUBBURIT: MAY BIND DNA AS HETEROLIMERS WHIT OTHER BZIP PROTEINS.

C -!- SUBGLICITY: IN ALL CELL TYPES EXAMINED.

C -!- SUBCLICITY: IN ALL CELL TYPES EXAMINED.

Submitted (MAY-1995) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: TOPOISOMERASE IV IS ESSENTIAL FOR CHROMOSOME
SEGREGATION. IT HAS RELAXATION OF SUPERCOILED DNA ACTIVITY.
PERFORMS THE DECATENATION EVENTS REQUIRED DURING THE REPLIC
OF A CIRCULAR DNA MOLECULE (BY SIMILARITY).

-!- SUBUNIT: COMPOSED OF TWO SUBUNITS: PARC AND PARE.
-!- SUBCELLULAR LOCATION: Membrane-associated (By similarity).
-!- SIMILARITY: STRONG, WITH THE A SUBUNIT OF GYRASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycoplasma genitalium.

SUBUNIT: DISULFIDE-LINKED HETERODIMER OF A LIGHT CHAIN (I HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL WHILE THE N-AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE CHAFORWATION AND TOXIN BINDING, RESPECTIVELY.
SUBCELLULAR LOCATION: Secreted.
MISCELLANEOUS: THERE ARE SEVEN ANTIGENICALLY DISTINCT FOR BOTULINUM NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.
SIMILARITY: BELLONGS TO PEPTIDASE FAMILY M27.

                           "Purification and reconstitution of the electron transport components for 6-deoxyerythronolide B hydroxylase, a cytochrome P-450 enzyme of macrolide antiblotic (erythromycin) blosynthesis.";

J. Bacteriol. 170:1548-1553(1988).

1- FUNCTION: FERREDOXIN ARE IRON-SULFUR PROTEINS THAT TRANSFER ELECTRONS IN A WIDE VARETY OF METABOLIC REACTIONS.

1- COFACTOR: BINDS 1 4FE-4S CLUSTER AND A 3FE-4S CLUSTER.

1- SIMILARITY: BELONGS TO THE BACTERIAL TYPE FERREDOXIN FAMILY.

1- SIMILARITY: BELONGS TO THE BACTERIAL TYPE FERREDOXIN FAMILY.
